

Passo a Passo

Passo 1

Criar um novo projeto

Passo 2

MainActivity.java

colocar `getSupportActionBar().hide();` no main java

Usado para não aparecer a barra no app

```
@Override
protected void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.activity_main);
    getSupportActionBar().hide();
}
```

Passo 3

Manifest > androidManifest

colocar `<uses-permission android:name="android.permission.CAMERA"/>` no androidManifest

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:tools="http://schemas.android.com/tools">
    <uses-permission android:name="android.permission.CAMERA"/>
    <application
```

Passo 4

MainActivity.java

```
if (ActivityCompat.checkSelfPermission(this, Manifest.permission.CAMERA)
    != PackageManager.PERMISSION_GRANTED) {
```

Manifest: Quando aparecer opções para completar escolha Manifest

`!= PackageManager.PERMISSION_GRANTED`): Se o app não possuir permissão, essa parte será usada para pedir a permissão

Passo 5

MainActivity.java

```
ActivityCompat.requestPermissions(this, new String[]{  
    Manifest.permission.CAMERA}, 0);
```

,0: É o pedido para o celular, sendo usado quando o app ultrapassa os limites dele mesmo

Gradle Scripts > Build Gradle(Project.camera)

```
plugins {  
    id 'com.android.application' version '7.3.1' apply false  
    id 'com.android.library' version '7.3.1' apply false  
}
```

Modificar os números os 2 (7.3.1), para 7.0.2

```
plugins {  
    id 'com.android.application' version '7.2.0' apply false  
    id 'com.android.library' version '7.2.0' apply false  
}
```

Passo 6

Gradle Scripts > Build.gradle(Module.camera.app)

```
implementation 'androidx.appcompat:appcompat:1.6.1'  
implementation 'com.google.android.material:material:1.8.0'
```

1.6.1 modificar para 1.4.1

1.8.0 modificar para 1.6.0

```
implementation 'androidx.appcompat:appcompat:1.4.1'  
implementation 'com.google.android.material:material:1.6.0'
```

Passo 7

Activity_main.xml

Adicionar:ImageView e button

Adicione:Id ao ImageView

Passo 8

MainActivity.java

```
findViewById(R.id.flavio);
```

Relaciona o xml ao Código java a partir da ImageView

```
public void tirarfoto(View v){  
    Intent i = new Intent(MediaStore.ACTION_IMAGE_CAPTURE);  
    startActivityForResult(i,1);  
}
```

Como o próprio nome já diz,essa parte fará a câmera ser usada pelo app

startActivityForResult(i,1);

Anotação: O startActivityForResult possui um risco sobre ele por ser uma versão ultrapassada,mas podendo ser usada ainda

Passo 9

MainActivity.java

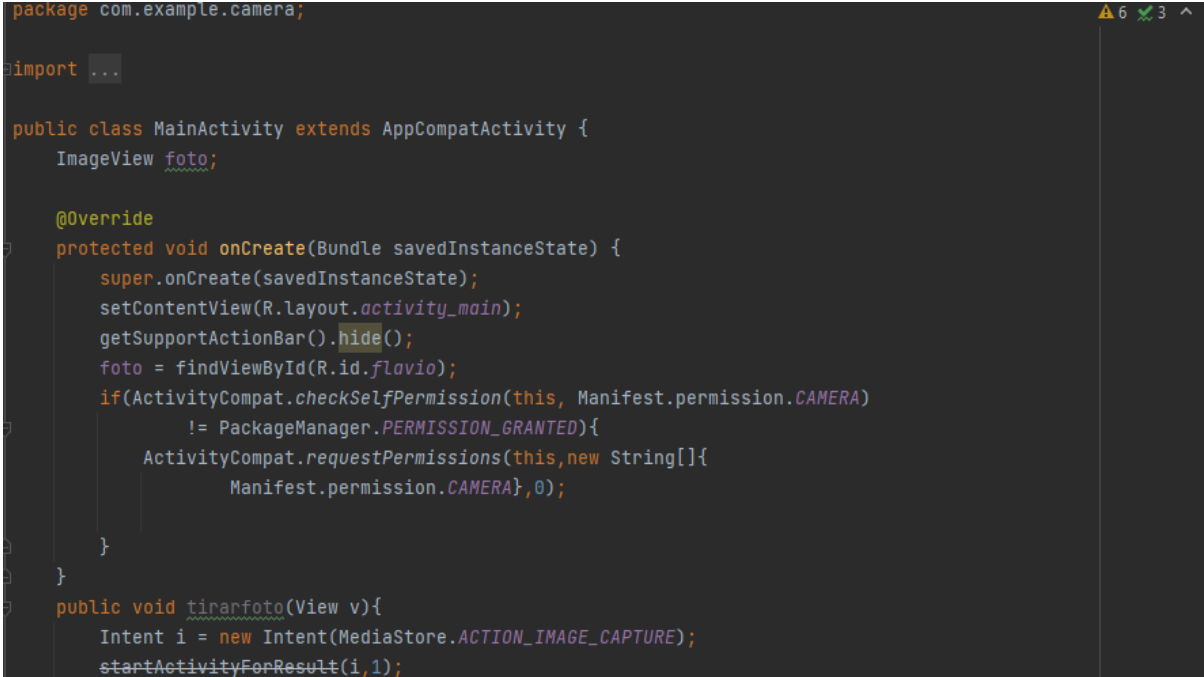

```
protected void onActivityResult(int requestCode, int resultCode, @Nullable Intent data) {  
    super.onActivityResult(requestCode, resultCode, data);  
    if(requestCode == 1 && resultCode == RESULT_OK){  
        Bundle dado = data.getExtras();  
        Bitmap imagem =(Bitmap) dado.get("data");  
        foto.setImageBitmap(imagem);  
    }
```

Agora será a parte dada a existência de sua imagem.

Passo 10

A decoração é por sua parte

Final

A screenshot of an IDE window showing the final code for MainActivity.java. The code includes package declarations, imports, and the implementation of onCreate and tirarfoto methods. The onCreate method sets the content view, hides the ActionBar, finds the photo view, and requests camera permissions. The tirarfoto method starts an image capture activity.

```
package com.example.camera;  
  
import ...  
  
public class MainActivity extends AppCompatActivity {  
    ImageView foto;  
  
    @Override  
    protected void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(R.layout.activity_main);  
        getSupportActionBar().hide();  
        foto = findViewById(R.id.flavio);  
        if(ActivityCompat.checkSelfPermission(this, Manifest.permission.CAMERA)  
            != PackageManager.PERMISSION_GRANTED){  
            ActivityCompat.requestPermissions(this,new String[]{  
                Manifest.permission.CAMERA},0);  
        }  
    }  
  
    public void tirarfoto(View v){  
        Intent i = new Intent(MediaStore.ACTION_IMAGE_CAPTURE);  
        startActivityForResult(i,1);  
    }
```

```

}

@Override
protected void onActivityResult(int requestCode, int resultCode, @Nullable Intent data) {
    super.onActivityResult(requestCode, resultCode, data);
    if(requestCode == 1 && resultCode == RESULT_OK ){
        Bundle dado = data.getExtras();
        Bitmap imagem =(Bitmap) dado.get("data");
        foto.setImageBitmap(imagem);
    }
}
}

```

Como fica a câmera

Poderá ser mexido a camera do celular para tirar fotos.
